KSISU: Evidence-First District Skill Intelligence

A reproducible method for sparse public labour-market evidence, explicit uncertainty, and data-acquisition prioritisation.

Sector: Manufacturing **NCO scope:** 72, 74 **FY:** 2022-23 **Monte Carlo:** 5,000 shared draws

What the prototype demonstrates	What it does not claim
31 Karnataka districts matched to LGD names	A proxy-only district ratio is a finding
Separate state demand evidence and district supply evidence	The partial NCVT subset is a district census
Shared uncertainty and reproducible runs	An official KSI formula
Human review for unmatched data	A policy call without full district supply
Value-of-information ranking	Validation of the proxy district ranking

Headline: public data can support an auditable inference chain, but the first policy output should often be a request for better district evidence.

1. Evidence ladder and data grain

Input	Grain	Year	Role
LGD district register	district	2026	canonical join key
Udyam district employment	district	2022 / 2023 publication	district allocation proxy
ASI Karnataka manufacturing	state	2022-23	state manufacturing employment base
NCVT MIS Karnataka ITI count	state	2022	state ITI seat magnitude
DGT/DITE tracer	division	2020-21	historical rate calibration
NCVT MIS File 1171 sample	district x ITI x trade	historical indexed	partial evidence only
Occupation mix	state prior	2022-23	analyst prior until PLFS microdata is loaded

Audit field	Purpose
file_id / SHA-256	stable artifact identity and tamper detection
source_id / URL / locator	reproducible source trail
period / grain	prevents silent state/district mixing
match method / confidence	shows how linkage was obtained
coverage status	controls whether policy output is eligible

The NCVT state page currently exposes Karnataka with 1,467 ITIs and 216,788 seats available for 2022. The model uses the state magnitude only; district supply is not assumed from that number.

2. Linkage and harmonisation

District: normalized exact -> production alias -> fuzzy match at 0.90 -> human review. Unmatched rows remain in the review queue.

Industry: NIC retained at the first two digits when a source code exists; labels without a code remain reviewable.

Course/trade: versioned human-reviewed NCO crosswalk. The project labels the crosswalk as an analyst mapping aid, not an official course-to-NCO master.

Validation result	Value
LGD districts	31 / 31
Seeded typo cases	80
Correct typo recovery	80 / 80 = 100.0%
Unseen aliases matched	0 / 20
Unseen aliases routed to review	20 / 20
Duplicate artifacts injected / removed	5 / 5
Unmatched rows dropped	0

Interpretation: unseen aliases are not counted as successful matches. The test is a review-queue test as well as a typo-recovery test.

3. Demand model - one basis, explicit priors

District manufacturing employment is allocated from the Karnataka ASI manufacturing total using Udyam employment shares. This keeps both sides on a consistent manufacturing base; it does not multiply Udyam all-sector employment by a manufacturing share.

NCO group	Share of total manufacturing	Status
72	0.25	modeled
74	0.15	modeled
Outside pilot	0.60	not modeled

Annual openings: O(d,o) = D(d,o) x opening rate, with 5% to 12% range and 8.5% mode.

Demand uncertainty	Low	Mode	High
Opening rate	5.0%	8.5%	12.0%
Occupation prior multiplier	0.80x	1.00x	1.20x

The occupation mix is the weakest demand input until PLFS occupation-by-industry microdata is extracted. This parameter is therefore part of the uncertainty and sensitivity story, not hidden inside a point estimate.

4. Tumakuru vs Kalaburagi - partial NCVT evidence is a floor

The bundled File 1171 rows are indexed NCVT MIS evidence, not a downloaded complete district extract. Observed seats are treated as a floor plus an uncertain remainder. Therefore a partial file can widen the interval rather than create fake precision.

District	NCO	Observed seats	Before width	After width	Change	After P10 / P50 / P90	Policy
Tumakuru	72	80	0.976	0.685	29.9%	0.60 / 0.87 / 1.29	NEEDS DATA
Tumakuru	74	60	0.755	0.528	30.1%	0.47 / 0.67 / 0.99	NEEDS DATA
Kalaburagi	72	60	0.917	0.622	32.2%	0.55 / 0.79 / 1.17	NEEDS DATA
Kalaburagi	74	n/a	0.709	0.709	0.0%	0.32 / 0.59 / 1.03	NEEDS DATA

What this page proves: the same model can ingest real district/trade rows without treating them as complete. The current subset is too small for a district-wide policy call. A complete 31-district x trade file is the next evidence gate.

Observed indexed rows	Seats
Tumakuru - Govt ITI Tumkur - Fitter	20
Tumakuru - Govt ITI Tumkur - Electrician	20
Tumakuru - Govt ITI Tumkur - Welder	40
Kalaburagi - Govt ITI Wadi - Fitter	20
Kalaburagi - Govt ITI Wadi - Welder	40

5. Supply model and conservation check

S(d,o) = seats(d,c) x fill x completion x sector-entry x crosswalk(c->o). Seats, completions and sector entry remain separate quantities.

Input	Current handling
State ITI seats	216,788 seats available in NCVT MIS state row; state magnitude only
Selected course weight	0.82 across NCO 72 + 74; not normalized
Fill rate	50% / 81.3% / 90%
Completion rate	50% / 59.3% / 70%
Sector entry	20% / 30.0% / 40%
Allocation	NCVT district ITI-count weights when supplied; otherwise explicit equal-within-division fallback

Conservation diagnostic	Value
Expected mode statewide supply	25,711
Sum of district/group supply medians	21,956
Median/expected ratio	0.854
Decision	PASS - within 25% of the mode expectation

The conservation check is designed to catch the former second-division bug: proxy seats are already split to districts, so the common allocation draw is a multiplier with mean 1.0 rather than another 1/n share.

6. Relative index and data-collection priority

SCI(d) = weighted share of modeled openings covered at R=min(S/D,1). For proxy-only data, the district ranking is explicitly a **data-collection view**, not a validated labour-market finding.

Priority	District	SCI	Relative	Openings	Data priority
1	Ramanagara	1.000	1.30x	404	621
2	Chikkaballapur	1.000	1.30x	563	587
3	Kolar	0.807	1.05x	1,380	541
4	Tumakuru	0.771	1.00x	1,436	535
5	Gadag	1.000	1.30x	300	521
6	Uttara Kannada	1.000	1.30x	470	518
7	Haveri	1.000	1.30x	760	491
8	Vijayapura	0.933	1.21x	934	491
9	Bengaluru Rural	0.403	0.52x	2,743	486
10	Bagalkot	0.828	1.07x	1,103	486
11	Dharwad	0.802	1.04x	1,133	461
12	Belagavi	0.401	0.52x	2,284	444

State median SCI = **0.771**. The district proxy ranking is not presented as validation because district supply still depends on proxy allocation. The correct policy use is: **which district should KSISU onboard first?**

Current proxy allocation diagnostic: correlation with Udyam demand share = **0.338**. This is reported as a diagnostic only; it is not proof that the proxy ranking is correct.

7. Sensitivity as rank stability, not range arithmetic

The model now uses the shared Monte Carlo draws to test whether district ranking is stable under common uncertainty. This avoids the previous sensitivity table that simply restated the chosen low/high ranges.

District	Baseline rank	P10	Median	P90	Top-5 frequency	Global rho
Chamarajanagar	1	1	1	11	79.9%	0.817
Chikkaballapur	2	1	2	7	88.4%	0.817
Gadag	3	2	3	6	84.2%	0.817
Haveri	4	4	7	17	31.4%	0.817
Uttara Kannada	5	5	8	13	16.4%	0.817
Vijayanagara	6	5	8	13	13.8%	0.817
Ramanagara	7	4	6	11	40.3%	0.817
Kodagu	8	4	6	14	38.0%	0.817
Yadgir	9	7	11	18	1.3%	0.817
Vijayapura	10	8	13	20	0.4%	0.817
Bagalkot	11	1	14	23	22.6%	0.817
Kolar	12	8	15	22	1.8%	0.817
Dharwad	13	4	15	23	14.3%	0.817
Chikkamagaluru	14	3	15	26	21.7%	0.817
Koppal	15	8	15	23	1.9%	0.817
Tumakuru	16	10	16	23	0.4%	0.817
Udupi	17	8	16	25	1.6%	0.817
Bidar	18	2	16	23	16.3%	0.817

Interpretation: a narrow rank band and high top-5 frequency indicate a stable prioritisation signal. A wide band indicates that KSISU should not over-interpret the ranking until the district evidence improves.

8. Validation, provenance and reproducibility

Test	Result	Interpretation
District linkage	31 / 31 matched	canonical LGD mapping
Seeded typo recovery	80 / 80 (100.0%)	correctness, not just non-empty match
Unseen aliases	0 matched; 20 review	unknown labels are not treated as successes
Duplicates	5 injected; 5 removed	real dedupe pass
Rows dropped	0	unmatched evidence stays reviewable
Monte Carlo	5,000 draws; seed 20261016	reproducible
Statewide conservation	0.854 median/expected	catches allocation errors

Each source artifact carries file_id, SHA-256, URL, year, grain and locator. The run audit log records seed, draw count, source files and output files.

9. What KSISU should deploy next

Phase	Action	Decision enabled
1. Evidence registry	Preserve raw artifacts, source IDs, hashes and LGD/NIC/NCO mapping	reproducible evidence layer
2. Full NCVT district supply	Load complete district x trade ITI export	replace proxy supply with district actual
3. PLFS occupation x industry	Extract state occupation mix from microdata	replace analyst occupation prior
4. District manufacturing employment	Use DSDP/MIS or stronger district industry evidence	reduce allocation uncertainty
5. Production	Scheduled refresh, quality flags, human review, machine-readable outputs	continuous KSISU intelligence

Submission position: SCI, VOI, confidence and evidence gates are proposed methodology for the Skillathon, not the official Karnataka Skill Index formula.

Current blocker: the complete current NCVT MIS district x trade seat export must be loaded before a district-wide policy call can be made. The bundled partial rows are deliberately not presented as complete.

AI-use disclosure: AI assistance was used for code drafting, documentation and analysis design. Public-source provenance, assumptions and evidence tiers are retained in the package.
